

Error 404: Motivation not found.

it's a feature not a bug

**Thank you**

Please wait I finish building all components

Code is perfect, it's the environment that's wrong.

**Nothing to see here ... though what were you expecting to see**

---

Congratulations! You've unlocked the world's most incomplete resume!

I'm not ignoring the error, I'm just testing user patience.

---

**You've discovered a secret! This resume is still under construction, but hey, at least the button works!** When life gives you bugs, just patch them and keep coding. No one will ever know.

Everyone else: 'It's just a small task.' Me: spends the next 3 hours debugging the small task like it's a life or death situation.

Resume in development ... like an app, it's cooler when it's finished. Check back later for version 2.0.

You ever get told to do something, and you're like, 'I'll do exactly that... but in my own way'?

Well, well, well... look who found my 'Work in Progress' resume. You get a gold star for bravery!

Thank you for testing my resume. It's 30% done, 50% confusion and 20% pure magic

Code review: 'Why is this here?' Me: 'Because it was easier to add it than explain why not.'

**Warning: This resume may cause confusion, amusement, and a sudden urge to ask if I actually have a job.** actually i don't

this isn't a bug, it's an opportunity for innovation.

It's not slow, it's 'deliberately efficient'

Someone: 'Can you fix this bug?' Me: 'Sure, just let me create a whole new feature while I'm at it'

**You've clicked it! Now, please enjoy this placeholder while I figure out what the heck I want to be when I grow up.** It's not broken, it's just misunderstood.

Someone: 'You should do this.' 'You should have a wife' Me: 'Nah, I'll do me, thanks. It's a lifestyle.'

**Me, when life tries to force me into a box: 'Nah, I'm too busy making my own shape.'**

Life as a developer: Write some code, break some code, then Google 'how to fix broken code.' Rinse and repeat

Me: 'This is my final commit for today.' Also me: 'Wait, let me just refactor that last function...'

Advice from the team: 'Keep it simple.' Me: Writes 100-line function and comments 'This is fine.'

**When the client says, 'Just add a simple feature'... and you end up writing a whole new framework.**

When they say 'This is how you should do it,' but you've already thrown that script out the window and are writing your own movie.

**hey don't forget to try out the contact part it works too, and keep that smile**
